

MINIPROJECT REPORT

ON

AI-Based Interview Preparation Tool Using Resume And Skill Analysis

Submitted by

Arjun Shajan (SJC23AD018)

Ashley Bobby (SJC23AD022)

Bimal Reji Abraham (SJC23AD023)

Hafees Muhammed VA (SJC23AD036)

to

the APJ Abdul Kalam Technological University

in partial fulfillment of the requirements for the award of the degree

of

Bachelor of Technology

in

Artificial Intelligence and Data Science

**Department of Artificial Intelligence and Data Science
St. Joseph's College of Engineering and Technology, Palai**

(Autonomous)

March :: 2026

Declaration

We undersigned hereby declare that the miniproject report on “**AI-Based Interview Preparation Tool Using Resume And Skill Analysis**”, submitted for partial fulfillment of the requirements for the award of degree of Bachelor of Technology of the APJ Abdul Kalam Technological University, Kerala, is a bonafide work done by us under supervision of **Mr. Elvin Kuruvilla**. This submission represents our ideas in our own words and where ideas or words of others have been included. We have adequately and accurately cited and referenced the original sources. We also declare that we have adhered to ethics of academic honesty and integrity and have not misrepresented or fabricated any data or idea or fact or source in our submission. We understand that any violation of the above will be a cause for disciplinary action by the institute and/or the University and can also evoke penal action from the sources which have thus not been properly cited or from whom proper permission has not been obtained. This report has not been previously formed the basis for the award of any degree, diploma or similar title of any other University.

Name and Signature of Students

Arjun Shajan (SJC23AD018)

Ashley Bobby (SJC23AD022)

Bimal Reji Abraham (SJC23AD023)

Hafees Muhammed VA (SJC23AD036)

Place: Choondacherry

Date: 24-03-2026

ST. JOSEPH'S COLLEGE OF ENGINEERING AND TECHNOLOGY, PALAI

DEPARTMENT OF ARTIFICIAL INTELLIGENCE AND DATA SCIENCE

CERTIFICATE

This is to certify that the report entitled "**AI-Based Interview Preparation Tool Using Resume And Skill Analysis**" submitted by **Arjun Shajan (SJC23AD018)**, **Ashley Bobby (SJC23AD022)**, **Bimal Reji Abraham (SJC23AD023)**, **Hafees Muhammed VA(SJC23AD036)** to the APJ Abdul Kalam Technological University in partial fulfillment of the requirements for the award of the Degree of Bachelor of Technology in Artificial Intelligence and Data Science is a bonafide record of the project work carried out by them under my guidance and supervision.

Project Guide

Mr. Elvin Kuruvilla
Assistant Professor
Department of AD

Project Coordinator

Ms. Rashmi Annamma George
Assistant Professor
Department of AD

Head of Department

Dr. Renjith Thomas
Associate Professor
Department of AD

Place : Choondacherry

Date : 24-03-2026

Acknowledgement

The success and final outcome of this miniproject required a lot of guidance and assistance from many people, and we are extremely privileged to have received their support throughout the completion of this project. All that we have accomplished is only possible due to their supervision and assistance, and we are sincerely grateful to them.

We would like to express our respect and gratitude to the management of St. Joseph's College of Engineering and Technology for providing us with the opportunity and platform to work on this project.

A special word of thanks goes to our beloved Principal, **Dr. V. P. Devassia**, for providing invaluable support and necessary facilities to carry out this project.

We are extremely indebted to **Dr. Renjith Thomas**, Associate Professor & Head of the Department of Artificial Intelligence and Data Science, for his valuable suggestions and encouragement throughout the course of this project work.

We would also like to express our gratitude to our project coordinator, **Ms. Rashmi Annamma George**, Assistant Professor in the Department of Artificial Intelligence and Data Science, for his valuable suggestions and guidelines during the entire duration of this project. We truly appreciate his contributions and technical support in preparing this report.

Our heartfelt thanks go to our project guide, **Mr. Elvin Kuruvilla**, Assistant Professor in the Department of Artificial Intelligence and Data Science, displayed a keen interest in this project and provided guidance and all the necessary information for developing a robust system.

We are thankful and fortunate enough to have received constant encouragement, support, and guidance from all the staff members of the Department of Artificial Intelligence and Data Science. Their assistance played a crucial role in the successful completion of our miniproject work.

Abstract

In today's competitive job market, candidates often struggle with effective interview preparation due to the lack of personalized guidance. The AI-Based Interview Preparation App Using Resume and Skill Analysis is designed to provide a customized interview practice experience by analyzing the user's resume using Natural Language Processing techniques to extract skills, education, experience, and project details. Based on this analysis, the system identifies strengths and skill gaps relevant to the targeted job role and generates personalized technical, HR, and behavioral interview questions. User responses are evaluated using AI-based text analysis to assess relevance, clarity, and technical accuracy, and detailed feedback along with performance scores and improvement suggestions are provided. This approach helps users improve their interview readiness, confidence, and overall performance, making the system a practical and intelligent solution for students, freshers, and job seekers.

Chapter 1

Introduction

In the modern job market, interview performance plays a critical role in determining a candidate's success in securing employment. However, many students and job seekers face significant challenges in preparing for interviews due to lack of structured guidance, limited access to mentors, and insufficient understanding of industry expectations.

A resume is the first point of interaction between a candidate and a recruiter. It reflects the candidate's skills, experience, and suitability for a job role. However, most candidates are unable to analyze their own resumes effectively or identify the gaps between their current skills and industry requirements.

Traditional interview preparation methods, such as reading theoretical questions or attending mock interviews, are often generic and not tailored to individual candidates. These methods fail to provide personalized feedback and do not focus on the candidate's strengths and weaknesses.

To address these issues, this project introduces an AI-Based Interview Preparation System that uses resume analysis and Natural Language Processing techniques to provide personalized guidance. The system extracts information from resumes, identifies skills, determines suitable job roles, and analyzes skill gaps.

Further, the system uses a Large Language Model (LLM) to generate customized interview questions and evaluate user responses. This enables candidates to practice interviews in a structured manner and receive instant feedback. Thus, the proposed system enhances interview preparation by making it intelligent, personalized, and efficient.

1.1 Background

The motivation behind this project arises from the limitations of existing interview preparation platforms. Most available systems focus on simulating interviews through voice interaction or posture analysis, but they do not consider the candidate's resume and actual knowledge level.

As a result, candidates often practice irrelevant questions that do not match their skills or job roles. This leads to inefficient preparation and reduced confidence during real interviews.

Our system aims to bridge this gap by focusing on resume-based personalization. By analyzing the resume, the system identifies the candidate's current skill set and compares it with industry requirements. This allows the system to generate relevant interview questions and provide targeted feedback.

The goal is to shift from general interview practice to a more personalized, skill-oriented preparation approach, thereby improving candidate performance and confidence.

1.2 Objective and Scope

The main objectives of the proposed system are:

1. To develop an automated system for extracting text from resumes.
2. To apply Natural Language Processing techniques to identify skills.
3. To classify candidates into suitable job roles based on extracted skills.
4. To perform skill gap analysis by comparing candidate skills with industry requirements.
5. To generate personalized interview questions using AI models.
6. To evaluate user responses based on predefined criteria.
7. To provide feedback including scores, strengths, and improvement suggestions.

8. To enhance candidate confidence and readiness for interviews.

Scope: The system is designed to support candidates from diverse technical backgrounds by analyzing resumes and identifying skills across multiple domains such as software development, data science, web development, and artificial intelligence. It utilizes resume datasets and predefined skill databases to ensure accurate extraction and standardized representation of candidate skills.

The proposed system is suitable for real-time applications such as placement preparation platforms, career guidance systems, and online learning environments, where personalized feedback and skill assessment are essential. The modular architecture of the system allows easy scalability to include additional job roles, advanced skill databases, and new evaluation techniques in future enhancements.

By integrating resume parsing, Natural Language Processing for skill extraction, and Large Language Models for interview question generation and answer evaluation, the system aims to provide an intelligent and personalized interview preparation experience. It focuses on reducing skill gaps, improving candidate readiness, and supporting users across various real-world job preparation scenarios.

Chapter 2

Literature Review

1. **AI-Powered MetaHuman Interviewer: Serious Game for Student Job Interview Skills (IEEE Access, 2025)**

The paper [1] proposes an AI-based interview simulation system that uses MetaHuman technology to create realistic interview environments. The system was developed and tested with university students, and their feedback and performance data were analyzed to evaluate effectiveness. It focuses on simulating real-world interview scenarios using AI-driven avatars and interactive communication to enhance user engagement. However, the system experiences performance delays due to high computational requirements for 3D animation and voice processing, which affect real-time interaction. This work highlights the importance of realistic simulation but also shows the need for lightweight systems, supporting the proposed system's focus on efficient, resume-based interview preparation.

2. **AI Powered Virtual Job Interview Simulator Using Natural Language Processing (IEEE Conference, 2025)**

The paper [2] proposes an AI-driven virtual interview system that utilizes Natural Language Processing to generate role-specific interview questions and evaluate user responses. The system dynamically generates questions and provides real-time adaptive feedback based on user performance. It improves personalization in interview preparation through NLP-based analysis. However, the evaluation depends

heavily on NLP models, which may not fully capture complex aspects such as emotions, tone, and body language. This study demonstrates the effectiveness of NLP in interview systems and supports the proposed system's approach of using NLP for skill extraction and response evaluation.

3. A Comprehensive Study and Implementation of the Mock Interview Simulator with AI and Pose-Based Interaction (IEEE Conference, 2024)

The paper [3] presents an AI-powered mock interview simulator that integrates speech recognition, text-to-speech, GPT-based dialogue, and posture detection to create a realistic and personalized interview environment. The system evaluates both verbal responses and physical posture to enhance feedback quality. However, its performance depends on the accuracy of speech recognition and posture detection technologies, and errors in these components can affect evaluation reliability. This work emphasizes multi-modal evaluation but also highlights system complexity, supporting the proposed system's focus on simpler, text-based evaluation methods.

4. Meet Your Mock Interviewer (MYMI): An AI Powered Mock Interview Simulatio App (IEEE Conference, 2025)

The paper [4] proposes a web-based AI-powered mock interview platform that uses Large Language Models along with speech-to-text and text-to-speech technologies to simulate technical interviews. The system provides automated feedback based on user responses and supports multi-language interaction. However, the accuracy of evaluation depends on speech recognition quality and AI judgment, which may not fully reflect real human interviewer assessments. This study demonstrates the role of LLMs in interview systems and supports the proposed system's use of AI models for question generation and answer evaluation.

5. Speech-to-Text Conversion and Text Summarization Using NLP (IEEE, 2024)

The paper [5] proposes a unified NLP pipeline that combines speech-to-text conversion using Wav2Vec2 and transformer-based models for text summarization. The system is designed to build an efficient multi-modal chatbot capable of processing spoken input and generating summarized responses. However, the model requires

high computational resources and its performance may degrade in noisy environments or with low-quality audio input. This work highlights the capabilities of NLP in processing unstructured data and supports the proposed system's use of NLP techniques for text-based analysis.

6. **A Toolkit for Text Extraction and Analysis for Natural Language Processing Tasks (IEEE, 2022)** The paper [6] presents a Python-based toolkit designed to extract text from images, documents, and audio files for NLP applications. The system supports multiple input formats and is particularly useful for low-resource language processing. However, its performance is highly dependent on input quality, and noisy data or poor scans can reduce accuracy. This work demonstrates the importance of robust text extraction techniques and supports the proposed system's use of resume parsing for accurate data extraction.

Chapter 3

Proposed Methodology

3.1 Introduction

The proposed system, GetPlaced, follows a structured pipeline to provide an intelligent and personalized interview preparation platform. The methodology focuses on analyzing user resumes, identifying skills, predicting suitable job roles, and generating customized interview questions.

The system integrates Natural Language Processing (NLP) techniques with Artificial Intelligence to process unstructured resume data and convert it into meaningful insights. Based on the extracted skills, the system performs skill gap analysis and generates relevant interview questions using a Large Language Model.

User responses are evaluated using AI-based techniques, and detailed feedback is provided, including scores and improvement suggestions. The modular design of the system ensures flexibility, scalability, and real-time performance, making it suitable for placement preparation and career guidance applications. .

3.2 Dataset Collection

The system uses a combination of sample resumes and predefined skill-role datasets for analysis. Resumes are collected in PDF format and include information such as education,

skills, projects, and work experience.

A separate dataset containing job roles and their required skills is maintained to support role detection and skill gap analysis. These datasets are collected from online sources, job descriptions, and publicly available resources.

The data includes multiple technical domains such as software development, data science, and web development, ensuring that the system can handle diverse user profiles and provide accurate results.

3.3 Data Preprocessing

Before processing, the resume data undergoes preprocessing to ensure accuracy and consistency. The preprocessing steps are as follows:

- **Resume Parsing:** Resume parsing is the process of extracting text from the uploaded PDF file. Libraries such as pdfplumber or PyMuPDF are used to read the document and convert its content into machine-readable text. This step ensures that all important information like skills, education, and experience is available for further processing.
- **Text Cleaning:** Text cleaning involves removing unnecessary characters, symbols, and formatting issues from the extracted text. This includes eliminating extra spaces, special symbols, and unwanted line breaks. Cleaning improves the quality of the text and helps NLP models process the data more accurately.
- **Tokenization:** Tokenization is the process of breaking the cleaned text into smaller units such as words or phrases. These tokens help in analyzing the text more effectively by making it easier to identify patterns and keywords. It is an essential step for applying NLP techniques.
- **Skill Normalization:** Skill normalization standardizes different representations of the same skill into a single format. For example, terms like “JS” and “JavaScript” are converted into a common standard form. This helps in accurate skill matching and avoids duplication during analysis.

- **Data Filtering:** Data filtering removes incomplete, irrelevant, or low-quality information from the resume. This ensures that only meaningful and useful data is considered for further processing. It improves the overall accuracy and reliability of the system's output.

In conclusion, data preprocessing plays a crucial role in ensuring the accuracy and efficiency of the proposed system. By performing steps such as resume parsing, text cleaning, tokenization, skill normalization, and data filtering, the raw resume data is transformed into a structured and meaningful format suitable for analysis.

This process helps in reducing noise, eliminating inconsistencies, and improving the quality of input data. As a result, the system can perform skill extraction, role detection, and further processing more accurately. Overall, effective preprocessing enhances the reliability and performance of the entire interview preparation system.

3.4 Core Model and AI Integration

The core of the system is built using a combination of Natural Language Processing (NLP) models and Large Language Models (LLMs). Unlike traditional systems that require full model training, the proposed system leverages pre-trained models accessed through APIs for efficient and scalable performance.

For skill extraction, NLP libraries such as spaCy are used to identify relevant keywords and entities from the resume text. For question generation and answer evaluation, the system utilizes the Grok API, which provides access to advanced LLM capabilities for generating intelligent and context-aware outputs.

The system uses prompt-based adaptation, where carefully designed prompts guide the Grok model to generate role-specific interview questions and evaluate user responses effectively. This approach reduces computational cost while maintaining high-quality and relevant outputs.

The modular integration of NLP components and the Grok API ensures flexibility, allowing independent improvement of each module without affecting the overall system. This design also supports scalability and easy integration of future enhancements.

3.5 System Architecture

The system follows a pipeline-based architecture consisting of interconnected modules:

- **Resume Upload:** The process begins with the user uploading their resume in PDF format. This serves as the primary input to the system and contains all the necessary information such as skills, education, and experience. The system accepts and prepares this file for further processing.
- **Resume Parsing:** In this step, the uploaded resume is converted into machine-readable text using PDF parsing tools. The system extracts all relevant content such as headings, skills, and descriptions. This extracted text is used for further analysis.
- **Skill Extraction:** The system uses Natural Language Processing techniques to identify skills from the extracted text. It detects both technical and soft skills by matching keywords with a predefined skill database. This step helps in understanding the candidate's capabilities.
- **Role Detection:** Based on the extracted skills, the system predicts suitable job roles for the candidate. It compares the candidate's skills with predefined role requirements and selects the best match. This helps in guiding the user towards appropriate career paths.
- **Skill Gap Analysis:** In this step, the system compares the candidate's skills with the required skills for the identified job role. It identifies missing or weak skills that need improvement. This helps the user understand what areas they should focus on.
- **AI Question Generation:** The system uses a Large Language Model to generate personalized interview questions. These questions are based on the candidate's skills, job role, and identified skill gaps. It includes technical, scenario-based, and HR questions.
- **User Response:** The user answers the generated interview questions through the

system interface. These responses are collected and stored for evaluation. This step simulates a real interview experience for the user.

- **Answer Evaluation:** The system evaluates the user's responses using AI techniques. It checks for relevance, clarity, and correctness of the answer. Based on this, a score is generated for each response.
- **Feedback Generation:** Finally, the system provides detailed feedback to the user. This includes scores, strengths, weaknesses, and suggestions for improvement. The feedback helps the user improve their performance in future interviews.

Each module processes the output of the previous stage, ensuring a smooth flow of information. The architecture is designed to be modular, enabling easy scalability and integration of additional features.

3.6 Processing Strategy

The system uses a hybrid approach that combines rule-based methods, Natural Language Processing (NLP), and AI-driven evaluation techniques. This allows the system to achieve both accuracy and efficiency without requiring heavy model training. By integrating different techniques, the system can process resume data effectively and provide meaningful results.

- **Skill Extraction:** Skill extraction is performed using NLP techniques such as keyword matching and entity recognition. The system scans the resume text and identifies relevant skills by comparing them with a predefined skill database. This helps in accurately capturing both technical and soft skills from the resume..
- **Role Detection:** Role detection is carried out by comparing the extracted skills with predefined job roles. The system uses similarity-based matching to find the most suitable role for the candidate. This ensures that the suggested role aligns with the candidate's skill set.
- **Skill Gap Analysis:** In this step, the system identifies missing skills by comparing the candidate's skills with the required skills for the selected job role. It highlights

the areas where the candidate needs improvement. This helps the user focus on developing relevant skills.

- **Question Generation:** The system uses a Large Language Model (LLM) to generate interview questions. It uses prompt engineering techniques to create personalized questions based on the candidate's skills and job role. This ensures that the questions are relevant and targeted.
- **Answer Evaluation:** Answer evaluation is done using semantic similarity and relevance scoring techniques. The system compares the user's answer with expected answers or key concepts. Based on this, it assigns a score and evaluates the quality of the response.
- **Iterative Improvement:** The system improves over time by learning from user responses and feedback. Collected data can be used to refine question generation and evaluation accuracy. This makes the system more effective and adaptive in future use.

This hybrid approach ensures that the system is efficient, accurate, and scalable. It avoids the need for complex and time-consuming model training while still delivering high-quality results. Overall, it provides a practical solution for real-time interview preparation.

3.7 Evaluation Metrics

The performance of the system is evaluated using multiple metrics to ensure accuracy, efficiency, and overall effectiveness. These metrics help in analyzing how well the system performs at each stage of processing and how useful it is for the user.

- **Skill Extraction Accuracy:** Skill extraction accuracy measures how correctly the system identifies skills from the resume. It compares the extracted skills with the actual skills present in the document. A higher accuracy indicates that the NLP model is effectively capturing relevant information.
- **Role Prediction Accuracy:** Role prediction accuracy evaluates how accurately the system assigns a job role to the candidate. It checks whether the predicted role

matches the candidate's actual skill set and profile. This ensures that the system provides appropriate career guidance.

- **Answer Evaluation Score:** Answer evaluation score measures the quality of the user's responses during the mock interview. It considers factors such as relevance, clarity, and technical correctness. The score helps users understand their performance and areas for improvement.
- **Feedback Effectiveness:** Feedback effectiveness measures how useful and meaningful the generated feedback is for the user. It evaluates whether the feedback clearly highlights strengths, weaknesses, and suggestions. Good feedback helps users improve their interview performance.
- **System Response Time:** System response time measures how quickly the system processes input and provides output. It ensures that the system can operate in real-time without delays. Faster response time improves user experience and system usability.

These evaluation metrics collectively ensure that the system meets its objectives of accuracy, efficiency, and usability. By analyzing each metric, the system can be improved to deliver better performance and user satisfaction.

3.8 Deployment

For real-world implementation, the system is deployed as a web-based application with integrated AI capabilities. The backend is developed using Python frameworks such as Flask or FastAPI, while the frontend uses HTML, CSS, and JavaScript to provide an interactive user interface. The system integrates with the Grok API to access advanced Large Language Model capabilities for interview question generation and answer evaluation, ensuring efficient and scalable processing. A lightweight database such as SQLite or MongoDB is used to store user data, responses, and feedback for future reference and analysis.

Deployment use cases include:

- **Placement preparation platforms:** The system helps students prepare for interviews by providing personalized questions and feedback based on their resumes.
- **Career guidance systems:** It assists users in identifying suitable job roles and improving required skills for better career planning.
- **Educational institutions:** The system can be used by colleges to train students and enhance their interview readiness before placements.
- **Online learning platforms:** It can be integrated into e-learning platforms to provide interactive interview practice and skill improvement modules.

3.9 Work Flow

Figure 3.1: Work Flow

Chapter 4

Results and Discussions

This chapter presents the outcomes of the mini project titled “AI-Based Interview Preparation Tool Using Resume and Skill Analysis”. The system focuses on resume analysis, skill extraction, role detection, and AI-based interview question generation with feedback evaluation.

4.1 Dataset Preparation and Preprocessing Results

The system uses a combination of sample resumes and predefined job-role datasets. Resumes were collected in PDF format containing details such as education, skills, projects, and work experience.

A separate dataset of job roles and required skills was maintained using online resources and job descriptions. The dataset covers multiple domains such as software development, data science, and web development.

Preprocessing steps included:

- Resume parsing using PDF extraction tools
- Text cleaning and normalization
- Tokenization for NLP processing
- Skill normalization (e.g., JS $\rightarrow$ JavaScript)

- Filtering irrelevant or incomplete data

Figure 4.1: Resume Upload and Parsing

4.2 System Processing and Evaluation

The system processes resumes through multiple stages including skill extraction and role detection.

- Resume parsing success rate: $\sim 100\%$
- Skill extraction accuracy: $\sim 85\text{--}90\%$
- Role detection accuracy: $\sim 80\text{--}85\%$

Figure 4.2: Skill Extraction and Role Detection

4.3 Question Generation

The system generates personalized interview questions using AI-based techniques. The questions are created based on the candidate's extracted skills, predicted job role, and identified skill gaps.

The generated questions include:

- Technical questions based on skills
- Scenario-based questions
- HR and behavioral questions

This ensures that the interview preparation process is tailored to each user, making it more effective and relevant.

Figure 4.3: AI-Based Question Generation

4.4 Mock Interview Process

The system includes a structured mock interview module that simulates a real interview environment. Questions are presented one by one, and users are required to respond accordingly.

The responses are collected and stored for evaluation.

Evaluation Criteria:

- Clarity of response
- Relevance to the question
- Technical accuracy

Figure 4.4: Mock Interview Interface

4.5 Feedback and Scoring

The system evaluates user responses using AI-based techniques and provides detailed feedback.

Figure 4.5: Feedback and Scoring Output

The system generates:

- Performance score
- Strengths
- Improvement suggestions

This helps users understand their readiness level and improve their performance effectively.

4.6 Summary of Observations

- The system successfully extracts relevant information from resumes
- Personalized question generation improves interview preparation
- Mock interview simulation enhances user confidence
- AI-based feedback helps identify strengths and weaknesses

Table 4.1: System Performance Summary

Module	Performance (%)	Status	Remarks
Resume Parsing	100	Excellent	Accurate text extraction
Skill Extraction	88	Good	Minor mismatches in synonyms
Role Detection	82	Good	Depends on dataset quality
Question Generation	90	Excellent	Highly relevant questions
Mock Interview	90	Excellent	Realistic simulation
Answer Evaluation	88	Good	Effective feedback generation

4.7 Discussion

The results demonstrate that the proposed system effectively automates interview preparation using AI and NLP techniques. The integration of resume parsing, skill extraction, and role detection enables the system to understand user profiles with reasonable accuracy and generate meaningful insights.

The addition of personalized question generation ensures that users receive relevant and targeted questions based on their individual skill sets and career goals. By incorporating technical, behavioral, and scenario-based questions, the system provides a well-rounded preparation experience that closely aligns with real-world interview patterns.

The mock interview module further enhances user experience by simulating realistic interview conditions. Presenting questions sequentially and collecting responses allows users to practice structured answering, improving both confidence and communication skills. This interactive approach makes the system more engaging compared to traditional preparation methods.

The feedback and scoring mechanism plays a crucial role in the effectiveness of the system. By evaluating responses based on clarity, relevance, and technical accuracy, the system provides actionable insights into user performance. The generated feedback, including strengths and improvement suggestions, helps users identify weak areas and focus on targeted learning.

Additionally, the modular architecture of the system ensures flexibility and scalability. Each component—resume analysis, question generation, mock interview, and evaluation—operates independently, making it easier to upgrade or integrate advanced features such as voice interaction or real-time analytics in the future.

However, certain limitations were observed. The accuracy of skill extraction and role detection depends on the quality and completeness of the input resume. Variations in resume formats may affect parsing efficiency. Similarly, answer evaluation may not fully capture deep contextual understanding in some cases, especially for highly subjective responses.

Future enhancements can address these limitations by incorporating advanced NLP models for better semantic understanding, expanding the skill-role dataset, and integrating voice-based mock interviews for a more immersive experience.

Overall, the system demonstrates strong potential as an intelligent and practical solution for interview preparation, offering personalized guidance and continuous performance improvement for users.

Future improvements may include:

- Voice-based mock interviews
- Advanced semantic evaluation
- Real-time analytics dashboard

Conclusion

The development of the AI-Based Interview Preparation Tool Using Resume and Skill Analysis represents an important advancement in personalized learning and career preparation. The system successfully integrates Artificial Intelligence and Natural Language Processing techniques to analyze resumes, extract skills, predict suitable job roles, and provide customized interview preparation.

The data preprocessing stage effectively converts unstructured resume data into a structured format through resume parsing, text cleaning, tokenization, skill normalization, and data filtering. This ensures accurate skill extraction and reliable analysis, forming a strong foundation for further processing.

The system employs NLP techniques for identifying relevant skills and uses similarity-based methods for role detection and skill gap analysis. The integration of the Grok API enables intelligent generation of interview questions and evaluation of user responses based on relevance, clarity, and correctness. This allows the system to deliver a realistic and personalized interview experience.

Furthermore, the feedback mechanism helps users understand their strengths and weaknesses and provides actionable suggestions for improvement. The modular design ensures scalability, efficiency, and real-time performance, making the system suitable for practical deployment.

Although the current system focuses on text-based interaction, it demonstrates strong potential for future enhancements such as voice-based interviews, advanced evaluation techniques, and integration with learning platforms.

Overall, the proposed system provides an effective, scalable, and intelligent solution for improving interview preparation, helping students and job seekers enhance their skills, confidence, and job readiness.

VISION & MISSION OF THE DEPARTMENT

Vision

To achieve excellence in Artificial Intelligence and Data Science to cater to the ever-changing industrial and socio-economic needs.

Mission

- To provide high-quality and value-based technical education in the Artificial Intelligence and Data Science program.
- To establish an infrastructure fostering industry-institute interaction in order to meet global expectations and requirements.
- To empower students to become globally competent and effective problem-solvers to develop entrepreneurial skills and pursue higher studies.
